# Document Revision History

**Table 1: Document Revision History**

Revision	Date	Description
1.0	24-Oct-2019	Initial report release

## About this Report

The purpose of this report is to provide packet rate performance data for Mellanox ConnectX-5 Network Interface Cards (NICs) achieved with the specified Data Plane Development Kit (DPDK) release. The report provides both the measured packet rate performance and the procedures and configurations to replicate the results. This document does not cover all network speeds available with the ConnectX family of NICs and is intended as a general reference of achievable performance for the specified DPDK release.

## Target Audience

This document is intended for engineers implementing applications with DPDK to guide and help achieving optimal performance.

# 1 Test Description

## 1.1 General

Setup is made up of the following components:

1. HPE® ProLiant DL380 Gen10 Server
2. Mellanox ConnectX® NIC
3. IXIA® XM12 packet generator

## 1.2 Zero Packet Loss Test

Zero Packet Loss tests utilize **I3fwd** ([http://www.dpdk.org/doc/guides/sample\\_app\\_ug/l3\\_forward.html](http://www.dpdk.org/doc/guides/sample_app_ug/l3_forward.html)) as the test application for maximum throughput with zero packet loss at various frame sizes based on RFC2544 <https://tools.ietf.org/html/rfc2544>.

The packet generator transmits a specified frame rate towards the DUT and counts the received frame rate sent back from the DUT. Throughput is determined with the maximum achievable transmit frame rate and is equal to the received frame rate i.e. zero packet loss.

- Duration for each test is 60 seconds.
- Traffic of 8192 IP flows is generated per port.
- IxNetwork (Version 8.51EA) is used with the IXIA packet generator.

## 1.3 Zero Packet Loss over SR-IOV Test

Test is conducted in the same manner as the bare-metal zero packet loss test with the distinction of dpdk running in a Guest OS inside a VM utilizing SR-IOV virtual function.

## 1.4 Single Core Performance Test

Single Core performance tests utilize **testpmd** ([http://www.dpdk.org/doc/guides/testpmd\\_app\\_ug](http://www.dpdk.org/doc/guides/testpmd_app_ug)), with this test the max throughput is tested with a single CPU core. Average throughput within test duration (60 seconds) are the results recorded in this test.

- Duration for each test is 60 seconds.
- Traffic of 8192 UDP flows is generated per port.
- IxNetwork (Version 8.51EA) is used with the IXIA packet generator.

## 2

### Test #1

## Mellanox ConnectX-5 25GbE Throughput at Zero Packet Loss (2x 25GbE)

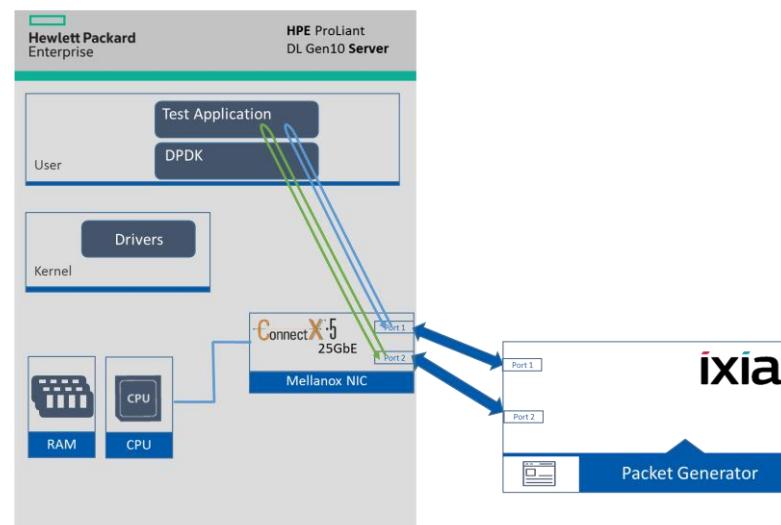

**Table 2: Test #1 Setup**

Item	Description
Test	Test #1 – Mellanox ConnectX-5 25GbE Dual-Port Throughput at zero packet loss
Server	HPE ProLiant DL380 Gen10
CPU	Intel(R) Xeon(R) Platinum 8168 CPU @ 2.70GHz 24 CPU cores * 2 NUMA nodes
RAM	384GB: 6 * 32GB DIMMs * 2 NUMA nodes @ 2666MHz
BIOS	U30 rev. 1.36 (02/15/2018)
NIC	One MCX512A-ACAT ConnectX-5 EN network interface card; 10/25GbE dual-port SFP28; PCIe3.0 x8; tall bracket; ROHS R6
Operating System	Red Hat Enterprise Linux Server 7.4 (Maipo)
Kernel Version	3.10.0-693.el7.x86_64
GCC version	4.8.5 20150623 (Red Hat 4.8.5-16) (GCC)
Mellanox NIC firmware version	16.25.1020
Mellanox OFED driver version	MLNX_OFED_LINUX-4.6-1.0.1.1
DPDK version	19.08
Test Configuration	1 NIC, 2 ports; Each port receives a stream of 8192 IP flows from the IXIA Each port has 4 queues assigned for a total of 8 queues 1 queue assigned per logical core with a total of 8 logical cores

Device Under Test (DUT) is made up of the HPE server and the Mellanox ConnectX-5 NIC with dual-port. The DUT is connected to the IXIA packet generator which generates traffic towards the ConnectX-5 NIC.

The ConnectX-5 data traffic is passed through DPDK to the test application **l3fwd** and is redirected to the opposite direction on the same port. IXIA measures throughput and packet loss.

**Figure 1: Test #1 Setup – Mellanox ConnectX-5 25GbE Dual-Port connected to IXIA**

## 2.1 Test Settings

**Table 3: Test #1 Settings**

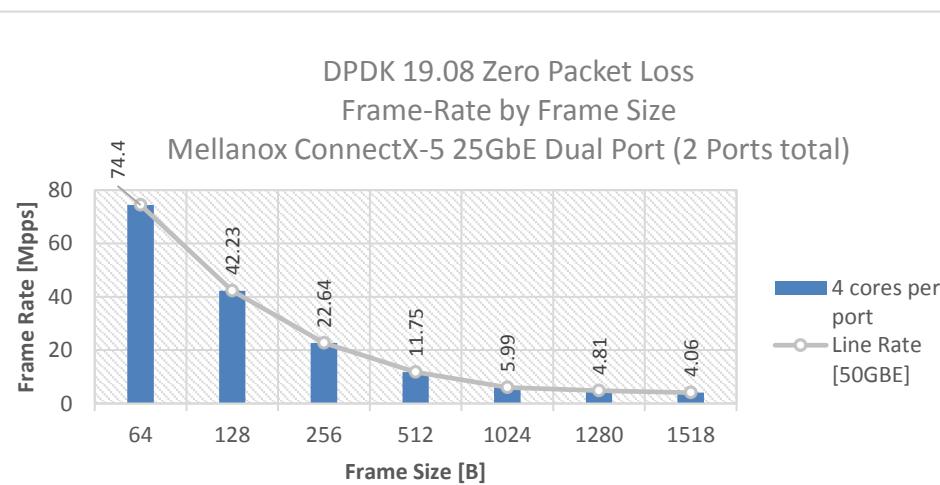

Item	Description
BIOS	1) Workload Profile = "Low Latency"; 2) Jitter Control = Manual, 3400. See "Configuring and tuning HPE ProLiant Servers for low-latency applications": <a href="http://hpe.com">hpe.com</a> > Search "DL380 gen10 low latency"
BOOT Settings	isolcpus=24-47 intel_idle.max_cstate=0 processor.max_cstate=0 intel_pstate=disable nohz_full=24-47 rcu_nocbs=24-47 rcu_nocb_poll default_hugepagesz=1G hugepagesz=1G hugepages=64 audit=0 nosoftlockup
DPDK Settings	Enable mlx5 PMD before compiling DPDK: In .config file generated by "make config", set: "CONFIG_RTE_LIBRTE_MLX5_PMD=y" During testing, l3fwd was given real-time scheduling priority. set environment variable "export MLX5_SHUT_UP_BF=1"
L3fwd settings	Added /l3fwd/main.c:85: #define RTE_TEST_RX_DESC_DEFAULT 4096 #define RTE_TEST_TX_DESC_DEFAULT 4096 Added /l3fwd/l3fwd.h:47: #define MAX_PKT_BURST 64
Command Line	./examples/l3fwd/build/app/l3fwd -c 0xffff0000000000 -n 4 -w d8:00.0,mprq_en=1 -w d8:00.1,mprq_en=1 --socket-mem=0,8192 -- -p 0x3 -P -- config='(0,0,47),(0,1,46),(0,2,45),(0,3,44),(1,0,43),(1,1,42),(1,2,41),(1,3,40)' --eth-dest=0:00:52:11:22:33:10 --eth-dest=1:00:52:11:22:33:20
Other optimizations	a) Flow Control OFF: "ethtool -A \$netdev rx off tx off" b) Memory optimizations: "sysctl -w vm.zone_reclaim_mode=0"; "sysctl -w vm.swappiness=0" c) Move all IRQs to far NUMA node: "IRQBALANCE_BANNED_CPUS=\$LOCAL_NUMA_CPUMAP irqbalance -oneshot" d) Disable irqbalance: "systemctl stop irqbalance" e) Change PCI MaxReadReq to 1024B for each port of each NIC: Run "setpci -s \$PORT_PCI_ADDRESS 68.w", it will return 4 digits ABCD --> Run "setpci -s \$PORT_PCI_ADDRESS 68.w=3936" f) Set CQE COMPRESSION to "AGGRESSIVE": mlxconfig -d \$PORT_PCI_ADDRESS set CQE_COMPRESSION=1 g) Disable Linux realtime throttling: echo -1 > /proc/sys/kernel/sched_rt_runtime_us

## 2.2 Test Results

**Table 4: Test #1 Results – Mellanox ConnectX-5 25GbE Dual-Port Throughput at Zero Packet Loss**

Frame Size (Bytes)	Frame Rate (Mpps)	Line Rate [50G] (Mpps)	% Line Rate
64	74.40	74.40	100.00
128	42.23	42.23	100.00
256	22.64	22.64	100.00

### Test #5

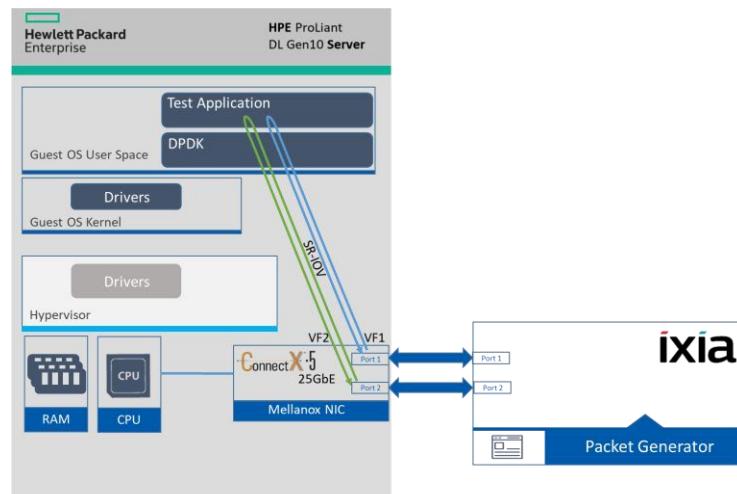

### Mellanox ConnectX-5 25GbE Throughput at Zero Packet Loss (2x 25GbE) using SR-IOV over VMware ESXi 6.5

**Table 14: Test #5 Setup**

Item	Description
Test	Test #5 – Mellanox ConnectX-5 25GbE Dual-Port Throughput at zero packet loss SRIOV over VMware ESXi 6.5U2
Server	HPE ProLiant DL380 Gen10
CPU	Intel(R) Xeon(R) Platinum 8168 CPU @ 2.70GHz 24 CPU cores * 2 NUMA nodes
RAM	384GB: 6 * 32GB DIMMs * 2 NUMA nodes @ 2666MHz
BIOS	U30 rev. 1.36 (02/15/2018)
NIC	One MCX512A-ACAT ConnectX-5 EN network interface card; 10/25GbE dual-port SFP28; PCIe3.0 x8; tall bracket; ROHS R6
Hypervisor	VMware ESXi 6.5U2
Hypervisor Build	VMware-ESXi-6.5.0-Update2-9298722-HPE-Gen9plus-650.U2.10.3.5.5-Sep2018.iso
Hypervisor Mellanox Driver	MLNX-NATIVE-ESX-ConnectX-4-5_4.16.14.2
Guest Operating System	Red Hat Enterprise Linux Server 7.4 (Maipo)
Guest Kernel Version	3.10.0-693.el7.x86_64
Guest GCC version	4.8.5 20150623 (Red Hat 4.8.5-16) (GCC)
Guest Mellanox OFED driver version	MLNX_OFED_LINUX-4.6-1.0.1.1
Mellanox NIC firmware version	16.25.1020
DPDK version	19.08
Test Configuration	1 NIC, 2 ports with 1 VF per port (SR-IOV); Each port receives a stream of 8192 IP flows from the IXIA Each VF (SR-IOV) has 4 queues assigned for a total of 8 queues 1 queue assigned per logical core with a total of 8 logical cores.

Device Under Test (DUT) is made up of the HPE server and the Mellanox ConnectX-5 NIC with dual-port. The DUT is connected to the IXIA packet generator which generates traffic towards the ConnectX-5 NIC. The ConnectX-5 data traffic is passed to VF1 (SR-IOV assigned to Port1) and VF2 (SR-IOV assigned to Port2) to VM running over ESXi 6.5 hypervisor. VM runs **l3fwd** over DPDK and is redirects traffic to the opposite direction on the same VF/port. IXIA measures throughput and packet loss.

**Figure 9: Test #5 Setup – Mellanox ConnectX-5 25GbE connected to IXIA using ESXi SR-IOV**

## 7

### Test #6

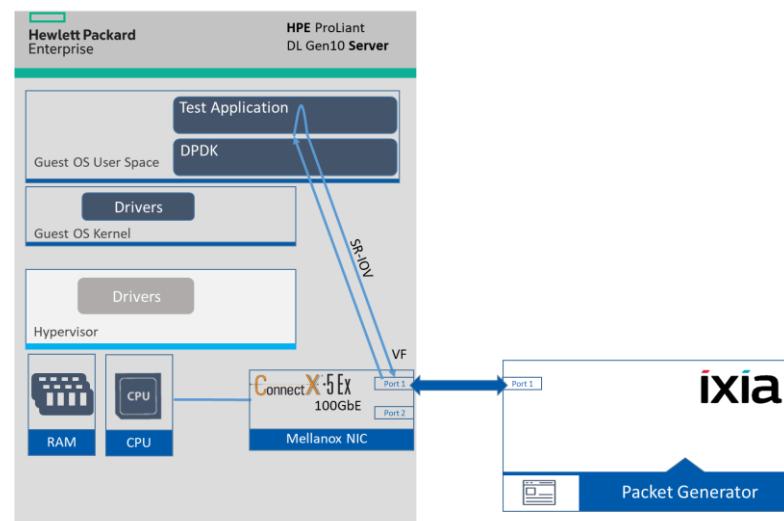

## Mellanox ConnectX-5 Ex 100GbE Throughput at Zero Packet Loss (1x 100GbE) using SR-IOV over KVM Hypervisor

**Table 17: Test #6 Setup**

Item	Description
Test	Test #6 – Mellanox ConnectX-5 Ex 100GbE Throughput at zero packet loss using SR-IOV over KVM
Server	HPE ProLiant DL380 Gen10
CPU	Intel(R) Xeon(R) Platinum 8168 CPU @ 2.70GHz 24 CPU cores * 2 NUMA nodes
RAM	384GB: 6 * 32GB DIMMs * 2 NUMA nodes @ 2666MHz
BIOS	U30 rev. 1.36 (02/15/2018)
NIC	One MCX516A-CDAT- ConnectX-5 Ex network interface card 100GbE dual-port QSFP28; PCIe3.0/PCIe4 x16; ROHS R6
Hypervisor	Red Hat Enterprise Linux Server 7.4 (Maipo) QEMU emulator version 1.5.3 (qemu-kvm-1.5.3-141.el7)
Hypervisor Kernel Version	3.10.0-693.el7.x86_64
Hypervisor Mellanox Driver	MLNX_OFED_LINUX-4.5-1.0.1.0
Guest Operating System	Red Hat Enterprise Linux Server 7.4 (Maipo)
Guest Kernel Version	3.10.0-693.el7.x86_64
Guest GCC version	4.8.5 20150623 (Red Hat 4.8.5-16) (GCC)
Guest Mellanox OFED driver version	MLNX_OFED_LINUX-4.6-1.0.1.1
Mellanox NIC firmware version	16.25.1020
DPDK version	19.08
Test Configuration	1 NIC, 1 port over 1 VF (SR-IOV); VF has 12 queues assigned to it, 1 queue per logical core for a total of 12 logical cores. Each physical port receives a stream of 8192 IP flows from the IXIA directed to VF assigned to Guest OS.

Device Under Test (DUT) is made up of the HPE server and the Mellanox ConnectX-5 Ex NIC with a dual-port (only first port used in this test) running Red Hat Enterprise Linux Server with qemu-KVM managed via libvirt, Guest OS running DPDK is based on Red Hat Enterprise Linux Server as well. The DUT is connected to the IXIA packet generator which generates traffic towards the ConnectX-5 Ex NIC. The ConnectX-5 Ex data traffic is passed through a virtual function (VF/SR-IOV) to DPDK running on the Guest OS, to the test application **l3fwd** and is redirected to the opposite direction on the same port. IXIA measures throughput and packet loss.

**Figure 11: Test #6 Setup – Mellanox ConnectX-5 Ex 100GbE connected to IXIA using KVM SR-IOV**
